

4: Fuel Pump Testing

When fuel has been drawn for a pump test, this function records the operation. It removes the fuel from the pump button, without selling the fuel, and allows the fuel to be returned to the appropriate tank.

Once the fuel drawn is showing on the pump button.

From the front POS screen select Menu → Fuel → Test Transaction

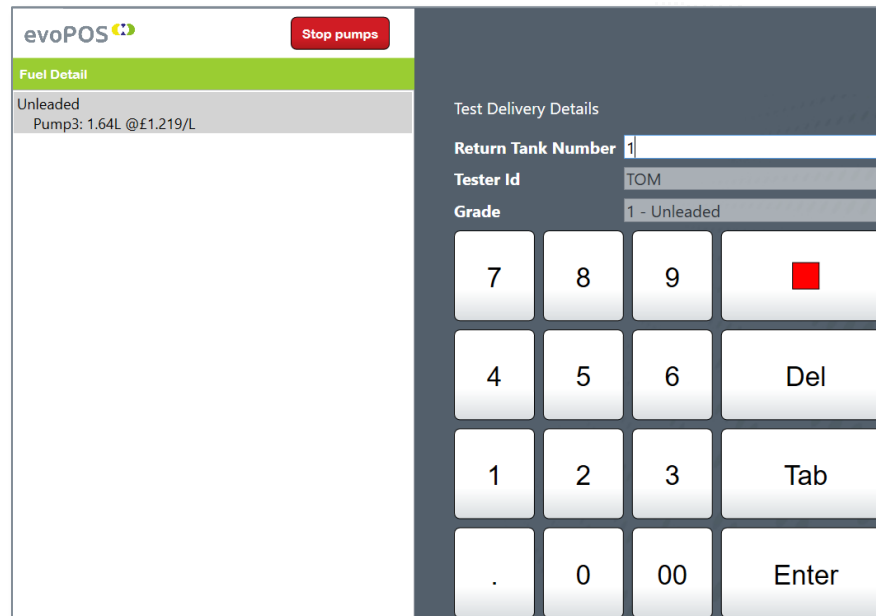

1

The screen will prompt to select the pump the test transaction is on.

If the test transaction has been selected in error, use the  button to exit the process.

2

Confirm the grade to send to the transaction window.

The screenshot shows the 'evoPOS' interface with a 'Fuel Detail' section on the left and 'Test Delivery Details' on the right. The 'Fuel Detail' section shows 'Unleaded' and 'Pump3: 1.64L @£1.219/L'. The 'Test Delivery Details' section has three input fields: 'Return Tank Number' (value: 1), 'Tester Id' (value: TOM), and 'Grade' (value: 1 - Unleaded). Below these fields is a numeric keypad with buttons for digits 0-9, a red square button, 'Del', 'Tab', and 'Enter'.

3

Enter the tank number the fuel has been returned to and the **Tester Id** of the person completing the test.

Select **Enter** to complete the process.

4

A receipt will be produced for the test transaction (but no payment taken).

Repeat if other pumps have been tested.
